

Paidline.

The contract is what says it's paid.

List work on Creditcoin. Anyone pays USDC on Ethereum. Attestcoin proves the transfer. Other apps ask isPaid. Agents hit HTTP 402. No custodian.

`paidline.vercel.app · github.com/Godwin-web3/paidline`

Creditcoin already proves a foreign payment. Apps still rebuild that path for one product.

Loans and scores

Useful. Not what a seller needs when they just want the invoice marked paid.

Custodial checkout

USDC sitting in someone else's contract.
Chargebacks of trust, not of math.

Human dashboards

Agents cannot click "Pay". They need 402, a pay URL, and 200 on retry.

A public board. First matching USDC claims it.

1. **List.** Title, exact USDC, a small Creditcoin lock, a due date.
2. **Pay.** Buyer sends USDC on Ethereum to the seller. Paidline never holds it.
3. **Prove.** Anyone submits the Attestcoin proof. Precompile 0x0FD2 decides inclusion.
4. **Stamp.** Match token, destination, exact amount. Emit InvoicePaid. Release the lock to the payer. isPaid becomes true.

The Creditcoin lock is a receipt bond, not the goods. The work is gated by isPaid or GET /api/gate/:id.

Remote proof. Local action.

STEP	WHO	WHAT
execute()	ASCBase	Merkle + continuity at 0x0FD2. queryId = chain, block, tx index.
processedQueries	ASCBase	Same leaf cannot settle twice.
_submitPayment	Paidline	Receipt status 1. Scan Transfer logs. Exact token / to / amount.
usedTxHashes	Paidline	Query id + proved body + claimed hash. A fake hash cannot relabel a payment.

The relayer fetches a proof and submits. It has no opinion. See docs/ATTESTCOIN.md.

One checker. Four callers.

Sellers

Put a retainer, a seat, or an API credit on the board. Do not pick the buyer.

Buyers

Send USDC the way they already send it. No new chain to operate.

Agents

GET /api/gate/:id → 402 + pay URL. After the stamp, the same call returns 200.

Other contracts

isPaid(id) or InvoicePaid. They never integrate Attestcoin.

We did not build another credit score. We built the primitive those apps should have called.

Not invoice financing

No investor, no LTV, no score curve. A listing is paid or it is not.

Not a bridge

USDC never moves to Creditcoin. Only the fact of payment does.

Working code. Working proof path. Working app.

THING	WHERE
App	<code>paidline.vercel.app</code>
Contract	<code>0x4fB6aB16B3CEf1853DF4247b245E4de139108339</code>
USDC	<code>0x1c7D4B196Cb0C7B01d743Fbc6116a902379C7238</code> · Sepolia
Demo	<code>paidline.vercel.app/demo</code> · 95s
Tests	<code>npm test</code> · <code>forge test --match, replay, revert, refund</code>

ASK

A checker the rest of the ecosystem can call.

Top-three CEIP fast-track so we can verify on mainnet, list real retainers, and keep the 402 gate in front of work that is actually for sale.
